

Ethernet data protocol ibeo LUX and ibeo LUX systems

Version History

Date	Version	Changes	
21.11.2008	1.0	Initial release	
03.12.2008	1.1	Added section 9 with ibeo API trace message	
04.40.2000	1.0	description	
04.12.2008	1.2	Correction of description of data type 2224 (ObjectList), Field ScanNumber removed.	
		(ObjectEist), Fleid Ocalification Terrioved.	
09.12.2008	1.3	New object data type 0x2225 (replaces 0x2224)	
27.1.2009	1.4	Corrected reply to GetStatus command –	
		reserved word removed	
		Another reserved word	
		in"SetNTPTimestampSec" and	
		"SetNTPTimestampFracSec" command	
		messages included	
		API and firmware version numbers integrated	
		FPGA and firmware version state are decimal	
13.3.2009	1.5	Changed default ID Address for LLIX to	
13.3.2009	1.5	Changed default IP-Address for LUX to 192.168.0.1	
27.3.2009	1.6	Corrected sync phase offset in 0x2202.	
6.4.2009	1.7	Comment added to set timestamp commands.	
11.6.2009	1.8	Data type of parameter TCP/IP port fixed.	
		Parameter name vehicle width fixed.	
16.6.2000	4.0	Default IP configuration of Ibeo ECU changed.	
16.6.2009	1.9	Corrected API/ECU data type trace message.	
31.7.2009	1.10	Clarified reset default parameters command. Steering ratio types added.	
31.7.2009	1.10	Default IP address of Ibeo ECU changed.	
		Format and text changes.	
01.10.2009	1.11	ECU Set filter command added.	
		2 2 2 2 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3	
05.10.2009	1.12	Fixed reserved values in set NTP time stamp	
		commands.	
14.10.2009	1.13	Clarified echo and layer encoding in 0x2202.	
20.11.2009	1.14	Added new/future scan data type 0x2205.	

www.ibeo-as.com Page 1 of 36

11.01.2010	1.15	Added scan flags in datatypes 0x2204 and 0x2205 Added scan flag mirror side in scan data type 0x2202
09.04.2010	1.16	Correction: Bounding box size is transmitted as width (Y-) and length (X-Coordinate) of bounding box, Datatype 0x2221
10.09.2010	1.17	In "ibeo LUX parameter list" add list of parameters that need a sensor restart to take effect.
05.10.2010	1.18	Replace commands SetNTPTimestampSec and SetNTPTimestampFracSec with command SetNTPTimestampSync. Add Customer Processing Switch 0 and Interface Flags to parameter list.
21.10.2010	1.19	More detailed description of SetFilterCommand for connection to an ECU.
05.11.2010	1.20	Added ibeo LUX vehicle state DataType 0x2805 with basic description
05.11.2010	1.21	More detailed description of 0x2805
16.11.2010	1.22	Description for ibeo ECU vehicle state data type (0x2806) added.
06.01.2011	1.23	Added description of transparency flag in scandata type 0x2205
29.03.2011	1.24	Added some description to the steer ratio polynom
05.07.2011	1.25	Some corrected mistakes concerning data type 0x2205, some more description
16.11.2011	1.26	Added description for yaw rate in date type LUX vehicle state (0x2805) Available since Firmware version 2.5.00.
28.11.2011	1.27	Follow-up to 1.26. Missing unit for yaw rate in data type LUX vehicle state (0x2805) added.
28.11.2011	1.28	Correction: Default IP address (ECU) 192.168.0.100
15.03.2012	1.29	Description for the sigma values added
26.04.2012	1.30	Table of Content updated
12.12.2012	1.31	Update fpga status, fpga error register and the fpga warning register
17.12.2012	1.32	Object box orientation in Datatype 0x2221 is not given in 1/32° but in 1/100°.
11.02.2013	1.33	Added DeviceType ParameterID to ethernet documentation

1 Introduction

This document describes how data is received and transmitted from respectively to ibeo sensors and systems via the Ethernet connection.

Adressed systems are ibeo LUX sensors with the firmware version 1.2.x and ECUs or applications using the current Ibeo API/software version 1.5.

The data protocol also describes the file format of an *idc file, as the same data types as transferred via Ethernet are stored within these files.

2 General information

2.1 Ethernet configuration

ibeo LUX sensors and Ibeo ECUs use default ethernet configurations until changed by the user.

ibeo LUX sensors use the default IP address 192.168.0.1 with the subnet mask 255.255.25.0. The default port is 12002.

Ibeo ECUs use the default IP address 192.168.0.100 with the subnet mask 255.255.255.0. Default port for data connection is 12002. Standard ports for telnet and FTP are used.

2.2 Data encoding

Attention! See the data type description if little or big endian byte order is used!

NTP64 timestamps represent the time encoded in 8 bytes. In order to decode NTP64 timestamps, the corresponding 8 bytes need to be interpreted as UINT64: The higher 4 bytes are the number of seconds since 1.1.1900 - 0:00:00. The lower 4 bytes represent the fractional seconds with a resolution of 2-32 s.

www.ibeo-as.com Page 4 of 36

2.3 Ibeo data header

Each message always starts with an Ibeo data header. To resync just search for the "magic word".

The Ibeo data header is encoded in network byte order / big endian format.

Bytes	Offset	Ibeo data header	Data type	Description
4	0	Magic word (0xAFFEC0C2)	UINT32	The "magic word" is used for searching Ibeo messages and to distinguish between different versions.
4	4	Size of previous messages	UINT32	Helps to navigate backwards through a file. Unused in live data.
4	8	Size of this message	UINT32	Helps to read the message data. Size of message content without this header.
1	12	Reserved	UINT8	-
1	13	DeviceID	UINT8	ID of the connected device. Unused in data received directly from ibeo LUX sensors.
2	14	Data type	UINT16	Specifies the data type within this message.
8	16	NTP time	NTP64	Time when this message was created.
	24	Message data	-	Depending on data type.

www.ibeo-as.com Page 5 of 36

3 ibeo LUX scan data: Data type 0x2202

Scan data available from ibeo LUX laserscanners (not available for ibeo LUX prototypes). Each scan data block starts with a header followed by the scan point list. The data is encoded in little endian format!

For angle information the unit angle ticks is used. An ibeo LUX typically uses 11520 ticks per rotation (see also Angle ticks per rotation below). Thus the angular resolution is 1/32°. This value is needed to convert angle ticks:

angle =
$$2\pi \frac{\text{angle ticks}}{\text{angle ticks per rotation}}$$

Angles are given in the ISO 8855 / DIN 70000 scanner coordinate system.

Bytes	Offset	Scan header:	Data type	Description
2	0	Scan number	UINT16	The number of this scan. The
				number will be increased from
				scan to scan.
2	2	Scanner status	bit field 16	0x0001: motor on
			bits	0x0002: laser on
				0x0004: internal feedback
				0x0008: set frequency reached
				0x0010: external sync signal
				detected
				0x0020: sync ok
				0x0040: sync master (instead of
				slave)
				0x0080: reserved
				0x0100: epw compensation on
				0x0200: system compensation
				on
				0x0400: start pulse
				compensation on
				0x0800: reserved
				0x1000: reserved 0x2000: reserved
				0x4000: reserved
				0x8000: reserved 0x8000: upside down (Release
				FPGA Version 0x9604)
2	4	Sync phase offset	UINT16	Phase difference (conversion
_	-	Cyric priase onset	CIIVIIO	factor 409.6 ns) between sync
				signal and scanner mirror
				crossing the synchronization
				angle.
8	6	Scan start time NTP	NTP64	NTP time when the first/last
8	14	Scan end time NTP	NTP64	measurement was done.
2	22	Angle ticks per rotation	UINT16	Number of angle ticks per
				rotation.
2	24	Start angle	INT16	Start/end angle in angle ticks of

www.ibeo-as.com Page 6 of 36

2	26	End angle	INT16	this scan.
2	28	Scan points	UINT16	Number of scan point
_		Cour points	OII TI	transmitted in this scan.
2	30	Mounting position yaw	INT16	Rotation of the scanner around
_		angle		the axes of the reference
2	32	Mounting position pitch	INT16	coordinate system. All angles
		angle		are given in angle ticks.
2	34	Mounting position roll	INT16	Order of translation and rotation
		angle		is essential: Yaw->Pitch->Roll-
				>Translation.
				Scan data is given in the
				scanner coordinate system
				without any transformation.
2	36	Mounting position x	INT16	Mounting position of the
2	38	Mounting position y	INT16	scanner relative to the
2	40	Mounting position z	INT16	reference coordinate system
				(ISO 8855 / DIN 70000
				coordinate system). The origin
				is located on flat ground under
				the center of the rear axle. X-
				axis faces to the vehicle front
				resp. straight driving direction. Y-axis faces left.
				The mounting position is needed for ego motion
				compensation (only available if
				scanner x-y-plane is almost
				parallel to the ground).
				All coordinates are given in
				centimeters. Order of
				translation and rotation is
				essential (Rotation ->
				Translation).
				The mounting position is used
				for ego motion compensation,
				not to transform scan data but
				is available for further
				processing steps.
2	42	Flags	UINT16	Bit 0: ground labeled
				Bit 1: dirt labeled
				Bit 2: rain labeled
				Bit 3: reserved
				Bit 46: internal
				Bit 79: reserved
				Bit 10: mirror side (0=front,
				1=rear) ¹
	4.4	Ones Dalist List	Onen Dala	Bit 1115: reserved
	44	Scan Point List	Scan Point	Array of scan points. See

 $[\]frac{1}{1}$ For use with 8-layer-scanners: 0 = 1 front = mirror facing down, 1 = 1 rear = mirror facing up www.ibeo-as.com

4 ibeo LUX object data: Data type 0x2221

Object data available from ibeo LUX laserscanners (not available for ibeo LUX prototypes).

Each data block starts with a header followed by the object list. Each object has a list of contour points.

The sigma values are calculated by Kalman filter by taking into account the object age. The data is encoded in little endian format!

Bytes	Offset	Object header:	Data type	Description
8	0	Scan start timestamp	NTP64	Time stamp of the first measurement of the scan these objects are updated with.
2	8	Number of objects	UINT16	The number of objects transmitted in this message.
	10	List of objects	Object	Array of objects.

Bytes	Offset	Object: content	Data type	Description
2	0	Object ID	UINT16	ID of this object from tracking.
2	2	Object age	UINT16	Number of scans this object
				has been tracked for.
2	4	Object prediction age	UINT16	Number of scans this object
				has currently been predicted for
				without measurement update.
				Set to 0 as soon as a
				measurement update is
				available.
2	6	Relative timestamp	UINT16	Timestamp of this object
				relative to the scan start time in
				ms. The time is based on the
				object reference point.
4	8	Reference point	Point2D	Depending on tracking this is
				the tracked object reference
				point (e.g. center of gravity) in
				cm. See below for Point2D.
4	12	Reference point sigma	Point2D	Standard deviation of the
				estimated reference point
				position in cm.
4	16	Closest point	Point2D	Unfiltered position of the closest
				object point in cm.
4	20	Bounding box center	Point2D	Center and size in cm of a
2	24	Bounding box width	UINT16	rectangle in the reference
2	26	Bounding box length	UINT16	coordinate system containing
				all object points. Width/length
				extend in Y-/X-coordinate.
4	28	Object box center	Point2D	Box center in the reference
4	32	Object box size	Size2D	coordinate system in cm.

www.ibeo-as.com Page 9 of 36

2	36	Object box orientation	INT16	Box size in cm and orientation in 1/100° in the object coordinate system (box rotated by orientation in reference coordinate system).
4	38	Absolute velocity	Point2D	Velocity of this object in cm/s with ego motion taken into account. This velocity is based on the reference coordinate system which is compensated by the ego motion. Value set to 0x8000 if invalid.
4	42	Absolute velocity sigma	Size2D	Standard deviation of the estimated absolute velocity in cm/s.
4	46	Relative velocity	Point2D	Velocity of this object in cm/s without ego motion compensation (sensor/vehicle is seen as stationary).
2	50	Classification	UINT16	Most likely class of this object: 0: unclassified 1: unknown small 2: unknown big 3: pedestrian 4: bike 5: car 6: truck 7: reserved
2	52	Classification age	UINT16	Number of scans this object has been classified as current class for.
2	54	Classification certainty	UINT16	The higher this value is the more reliable is the assigned object class.
2	56	Number of contour points	UINT16	The number of objects transmitted in this message.
	58	List of contour points	Point2D	Array of contour points in cm.

Bytes	Offset	Point2D:	Data type	Description
2	0	Position x	INT16	X-part/coordinate of this
				value/point.
2	2	Position y	INT16	Y-part/coordinate of this
				value/point.
	4			

Bytes	Offset	Size2D	Data type	Description
2	0	Size x	UINT16	X-value/size/width.
2	2	Size y	UINT16	Y-value/size/length.
	4			

www.ibeo-as.com Page 10 of 36

5 ibeo LUX vehicle state: Data type 0x2805

The vehicle state is calculated by ibeoLUX from received CAN-Data. CAN data parsers need to be configured in order to receive valid vehicle state information.

All angles, position and distances are given in the ISO 8855 / DIN 70000 scanner coordinate system.

Bytes	Offset	Vehicle State:	Data type	Description
8	0	Timestamp	NTP64	
2	8	Scan number	UINT16	For synchronisation with Scan
2	10	Error flags	UINT16	0x0001: Axle dist parameter is not set, i.e. is set to zero. 0x0100: Measurement of steering wheel angle not up-to-date 0x0200: Measurement of front wheel angle not up-to-date or could not be calculated using SteeringWheelAngle 0x0800: No CAN-data received
2	12	Longitudinal velocity	INT16	Longitudinal Velocity [0.01m/s]
2	14	Steering wheel angle	INT16	Angle by which the steering wheel is rotated compared to its middle position. [0.001rad]
2	16	Front wheel angle	INT16	Wheel angle (calculated from steering wheel angle if available) [0.0001 rad]
2	18	Reserved		
4	20	X position	INT32	Distance from origin in X-Direction [0.01m]
4	24	Y position	INT32	Distance from origin in Y-Direction [0.01m]
2	28	Course angle	INT16	Orientation at time timestamp [0.0001 rad]
2	30	Time difference	UINT16	Time difference between this and last vehicle state message [ms]
2	32	X difference	INT16	Distance driven in X during time difference [0.001m]
2	34	Y difference	INT16	Distance driven in Y during time difference [0.001m]
2	36	Heading difference	INT16	Difference in Heading during time difference [0.0001 rad]
2	38	Reserved		
2	40	Current yaw rate	INT16	Yaw rate from latest CAN-Message received. Available since firmware version 2.5.00. [0.0001 rad/s]
4	42	Reserved		
	46			

www.ibeo-as.com Page 11 of 36

Vehicle state information is to be considered as invalid if at least one error flag is set except 0x0100 or 0x0200, because the steering or front wheel angle is not necessary for vehicle state estimation. Warning W-EgoMotion of warning register 2 (see paragraph 6.4) is thrown if vehicle state information is invalid.

6 ibeo LUX errors and warnings - Data type 0x2030

As soon as an ibeo LUX Laserscanner detects an error or wants to emit a warning, this message is sent. Errors and warning bits are reset after sending this message. This message will be sent periodically as long as errors of warnings persist. The data is encoded in little endian format!

Bytes	Offset	LUX error/warning	Data type	Description
2	0	Error register 1	bit field 16 bits	See below
2	2	Error register 2	bit field 16 bits	
2	4	Warning register 1	bit field 16 bits	
2	6	Warning register 2	bit field 16 bits	
2	8	reserved	bit field 16 bits	
2	10	reserved	bit field 16 bits	
2	12	reserved	bit field 16 bits	
2	14	reserved	bit field 16 bits

7 ibeo LUX command interface

For sending commands to the ibeo LUX the data type 0x2010 is used. The data is encoded in little endian format!

Bytes	Offset	LUX command	Data type	Description
2	0	Command ID	UINT16	See detailed list of commands and according options/parameters.
2	2	Reserved	UINT16	Unused, but these 2 bytes must be sent for all commands.
	4	Command Data	-	Depending on command. May be completely missing for some commands.

The ibeo LUX replies to a command with a dedicated reply message. The data type used is 0x2020. The data is encoded in little endian format!

Bytes	Offset	LUX reply:	Data type	Description
2	0	Reply ID	UINT16	If a command succeeded, the reply ID is equal to the corresponding command ID. If a command failed, the reply ID is the command ID + 0x8000. Thus, the most significant bit indicates a failed command.
	2	Reply data	-	Depending on the corresponding command this reply is related to. May be completely missing for some commands and if a command failed. See detailed command description below.

www.ibeo-as.com Page 15 of 36

7.1 ibeo LUX commands and command replies – data types 0x2010/ 0x2020

7.1.1 Reset

Bytes	Offset	LUX command	Data type	Description
2	0	0x0000	UINT16	ID - Reset DSP
2	2	Reserved	UINT16	-

In case of command Reset no reply is sent.

7.1.2 Get Status

Bytes	Offset	LUX command	Data type	Description
2	0	0x0001	UINT16	Status request
2	2	Reserved	UINT16	-

Bytes	Offset	LUX reply	Data type	Description
2	0	0x0001	UINT16	Status request

7.1.3 SaveConfig

Bytes	Offset	LUX command	Data type	Description
2	0	0x0004	UINT16	Current sensor configuration will be saved permanently. Multiple SetParameter commands may be sent before saving the changes permanently.
2	2	Reserved	UINT16	-

The command SaveConfig will be acknowledged by the same command ID without command reply data.

7.1.4 Set Parameter

Bytes	Offset	LUX command	Data type	Description
2	0	0x0010	UINT16	Set a single Parameter by its index to the sensor memory. Parameter is set only temporarily until a SaveConfig command (see 7.1.3) is sent.
2	2	Reserved	UINT16	-
2	4	Parameter index	UINT16	Refer to ibeo LUX parameter list (see 7.2)
4	6	Parameter	UINT32	Set parameter accordingly to parameter list. If e.g. a 2 byte value is set, use the first 2 bytes. Fill the remaining 2 bytes with 0.

The command Set Parameter will be acknowledged by the same command ID without any command reply data.

7.1.5 Get Parameter

Bytes	Offset	LUX command	Data type	Description
2	0	0x0011	UINT16	Read a single Parameter with
				its index from the LUX.
2	2	Reserved	UINT16	-
2	4	Parameter index	UINT16	Refer to LUX parameter list
				(see 7.2)

Bytes	Offset	LUX reply	Data type	Description
2	0	0x0011	UINT16	Read a single Parameter by its index from the LUX.
2	2	Parameter index	UINT16	Refer to ibeo LUX parameter list (see 7.2)
4	4	Parameter	UINT32	

www.ibeo-as.com Page 18 of 36

7.1.6 Reset Default Parameters

Bytes	Offset	LUX command	Data type	Description
2	0	0x001A	UINT16	Resets all parameters to the factory defaults.
2	2	Reserved	UINT16	-

The command Reset Default Parameters will be acknowledged by the same command ID without any command reply data.

Send SaveConfig command (see 7.1.3) to reset default parameters permanently after this command.

7.1.7 Start Measure

Bytes	Offset	LUX command	Data type	Description
2	0	0x0020	UINT16	Starts the measurement with the current settings.
2	2	Reserved	UINT16	-

The command Start Measure will be acknowledged by the same command ID without any command reply data.

7.1.8 Stop Measure

Bytes	Offset	LUX command	Data type	Description
2	0	0x0021	UINT16	Stops the measurement.
2	2	Reserved	UINT16	-

The command Stop Measure will be acknowledged by the same command ID without any command reply data.

www.ibeo-as.com Page 19 of 36

7.1.9 SetNTPTimestampSync

Bytes	Offset	LUX command	Data type	Description
2	0	0x0034	UINT16	sets the second of NTPtimestamp.
2	2	Reserved	UINT16	-
2	4	Reserved	UNIT16	-
4	6	Seconds	UINT32	Seconds (NTP format).
4	6	Fractional seconds	UINT32	Fractional Seconds (NTP format).

The command SetNTPTimestampSync will be acknowledged by the same command ID without any command reply data.

www.ibeo-as.com Page 20 of 36

7.2 ibeo LUX parameter list

This table gives an overview of available ibeo LUX parameters. Please refer to 7.1.4 and 7.1.5 for details on getting and setting these parameters.

IP address, subnet mask and standard gateway encode the data as UINT32 value which is built like that: aa.bb.cc.dd = 0xaabbccdd. Due to little endian byte order this value must be sent as 0xddccbbaa.

A change of following parameters only take effect after a sensor restart (cycle power or use command reset):

- IP address (ID 0x1000)
- TCP Port (ID 0x1001)
- Subnet Mask (ID 0x1002)
- Standard gateway (ID 0x1003)
- CAN Baud Rate (ID 0x1011)
- Interface Flags (ID 0x1019)

Bytes	Parameter	LUX parameter	Data	Description
	index		type	
4	0x1000	IP address	UINT32	Valid: all
2	0x1001	TCP Port	UINT16	Valid: all
4	0x1002	Subnet Mask	UINT32	Valid: all
4	0x1003	Standard gateway	UINT32	Valid: all
2	0x1004	Customer Processing	UINT16	bit true: process
		Switch 0		false: do not process.
				bit0: dirt + rain detection.
				bit3/bit2: timeSyncMode:
				- 00: NMEA over RS232
				- 01: ETH
				- 10: CAN
				- 11: AUTO
4	0x1010	CAN Base ID	UINT32	Valid: value <= 0x7F0
2	0x1011	CAN Baud Rate	UINT16	in kBaud - next matching
				value (1000 kBaud, 500
				kBaud, 250 kBaud, 125
				kBaud) will be used.
2	0x1012	Data Output Flag	16 bit	Bit true: disable output, false:
			field	enable output. 0xFFFF is
				invalid.
				bit0: ETH scan data
				bit1: reserved/internal

8 Ibeo API/ECU scan data - Data type 0x2204

Scan data available from Ibeo API and Ibeo AppBase2 (ECU) are sent as data type 0x2204 until API version 2.1 and Ibeo Laserview 1.5. Please see data type 0x2205 for later versions.

Each scan data block starts with a header followed by the scanner info list and the scan point list. Each scan point has a device ID which refers to a sensor in the sensor info list. The data is encoded in network byte order / big endian format.

Bytes	Offset	Scan header	Data type	Description
8	0	Scan start time	NTP64	NTP time when the first
				measurement was done.
4	8	Scan end time offset	UINT32	Time difference between last
				and first measurement in us.

10 Ibeo API/ECU object data - Data type 0x2225

Object data available from Ibeo API and Ibeo AppBase2 (ECU). Each data block starts with a header followed by the object list. Each object has a list of contour points. The sigma values are calculated by Kalman filter by taking into account the object age. All positions and angles are given in the vehicle / reference coordinate system. Data is encoded in network byte order / big endian format.

Bytes	Offset	Object header	Data type	Description
8	0	Mid-scan timestamp	NTP64	Mid-scan timestamp is the absolute timestamp when the scanner mirror crossed the middle of the corresponding scan. Used for synchronization purpose.
2	8	Number of objects	UINT16	The number of objects transmitted in this message.
	10	List of objects	Object	Array of objects.

Bytes	Offset	Object	Data type	Description
2	0	Object ID	UINT16	ID of this object from tracking.
2	2	Reserved	UINT16	-
4	4	Object age	UINT32	Number of scans this object
				has been tracked for.
8	8	Timestamp NTP	NTP64	Time when this object was
				observed. More precisely: the
				reference point of this object.
2	16	Object hidden status	UINT16	Number of scans this object
		age		has only been predicted without
				measurement updates.
1	18	Classification	UINT8	Most likely class of this object:
				0: unclassified
				1: unknown small
				2: unknown big
				3: pedestrian
				4: bike
				5: car
				6: truck
				7: reserved
1	19	Classification certainty	UINT8	The higher this value is the
				more reliable is the assigned
				object class.
4	20	Classification age	UINT32	Number of scans this object
				has been classified as current
				class.
8	24	Bounding box center	Point2D	Center point of the bounding
				box of this object. See below for
				definition of Point2D.
8	32	Bounding box size	Point2D	Size of the bounding box (a

www.ibeo-as.com Page 32 of 36

				rectangle parallel to vehicle coordinate system).
8	40	Object box center	Point2D	Center point (tracked) of this object.
8	48	Object box center sigma	Point2D	Standard deviation of the object box center point.
8	56	Object box size	Point2D	Size of the object box in the object coordinate system (vehicle coordinate system rotated around z axis by object course angle).
8	64	Reserved	8 bytes	-
4	72	Yaw angle	FLOAT32	Orientation or heading of the object in radians.
4	76	Reserved	4 bytes	-
8	80	Relative velocity	Point2D	Velocity of this object in m/s relative to the ego vehicle. Ego motions is not taken into account here.
8	88	Relative velocity sigma	Point2D	Standard deviation of the relative velocity.
8	96	Absolute velocity	Point2D	Velocity of this object in m/s with ego motion taken into account. Inform about the object velocity in the 'real world'.
8	104	Absolute velocity sigma	Point2D	Standard deviation of the absolute velocity.
18	112	Reserved	18 bytes	-
1	130	Number of contour points	UINŤ8	Number of contour points transmitted for this object.
1	131	Index of closest point	UINT8	Closes contour point of this object as index of the point list.
	132	List of contour points	Point2D	Array of contour points (Point2D) in m.

Bytes	Offset	Point2D	Data type	Description
4	0	Position x	FLOAT32	X-part/coordinate of this value/point.
4	4	Position y	FLOAT32	Y-part/coordinate of this value/point.
	8			

11 Ibeo API/ECU vehicle state: Data type 0x2806

Vehicle state data available from Ibeo API and Ibeo AppBase2 (ECU).

All angles, position and distances are given in the ISO $8855 \, / \,$ DIN 70000 coordinate system.

www.ibeo-as.com Page 33 of 36

Bytes	Offset	Vehicle State:	Data type	Description
4	0	Reserved		
8	4	Timestamp	NTP64	Time stamp when this vehicle state was estimated
4	12	DistanceX	INT32	Distance from origin in x-direction [mm]
4	16	DistanceY	INT32	Distance from origin in y-direction [mm]
4	20	Course angle	FLOAT32	Orientation [rad]
4	24	Longitudinal velocity	FLOAT32	Longitudinal velocity [m/s]
4	28	Yaw rate	FLOAT32	Current yaw rate of vehicle [rad/s]
4	32	Steering wheel angle	FLOAT32	Angle by which the steering wheel is rotated compared to its middle position.
4	36	Reserved		
4	40	Front wheel angle	FLOAT32	Angle by which the front wheel is rotated compared to the vehicle's x-axis [rad]
2	44	Reserved		
4	46	Vehicle Width ²	FLOAT32	Vehicle width in [m]
4	50	Reserved		
4	54	Distance: Vehicle's ² front to front axle	FLOAT32	Distance: front axle to vehicle's front [m]
4	58	Distance: rear axle to front axle ²	FLOAT32	Distance: vehicle's rear axle to vehicle's front axle [m]
4	62	Distance: rear axle to vehicle's rear ²	FLOAT32	Distance: vehicle's rear axle to vehicle's rear [m]
4	66	Reserved		
4	70	SteerRatioPoly0 (s0) ²	FLOAT32	Coefficients for transfer function of steering wheel angle (x) to calculate
4	74	SteerRatioPoly1 (s1) ²	FLOAT32	front wheel angle (y):
4	78	SteerRatioPoly2 (s2) ²	FLOAT32	$y = \frac{x}{1.095(s_3 x^3 + s_2 x^2 + s_1 x + s_0)}$ if s ₀ =0
4	82	SteerRatioPoly3 (s3) ²	FLOAT32	$y = s_3 x^3 + s_2 x^2 + s_1 x + s_0$ if $s_0 \neq 0$
	86

12 Ibeo API/ECU Trace Messages - Data types 0x6400 .. 0x6440

Software modules which are deploying the Ibeo API for communication can sent trace messages consisting of a character string.

Trace Messages are distributed with 4 different data types dependent on their priority:

- Data type 0x6400 Error
- Data type 0x6410 Warning
- Data type 0x6420 Note
- Data type 0x6430 Debug Info

Bytes	Offset	Data	Data type	Description
1	0	Trace level	UINT8	Gives the trace level of this message. Currently this accords to the data type. 1=error, 2=warning, 3=note, 4=debug
Size of string	1	Trace message	String	Contains warnings and errors received from connected sensors. E.g. "IbeoLUX3 "ibeoLUX": DSP warning: Invalid vehicle motion data. To avoid this warning please uncheck 'Vehicle Motion Data expected' in device configuration. Code: 0x0100"
1	Size of string + 1	0x00	UINT8	End of string byte 0x00.
	Size of string + 2

13 Ibeo API/ECU Set Filter Command – Data type 0x2010

Before the Ibeo API or ECU sends data after connecting to it (default port 12002), a filter command must be sent.

Data is encoded in network byte order / big endian format.

Bytes	Offset	Data	Data type	Description
2	0	Command ID: Set filter	UINT16	0x0005
2	2	2 x Number of following data type ranges (= 2 * n)	UINT16	The number of following entries in the filter list.
2 * n	4	List of data type ranges	Data type range	Range of data types to receive
	4 + 2 * n			

Data type range:

Bytes	Offset	Data	Data type	Description
2	0	Start of data type range.	UINT16	
2	2	End of data type range.	UINT16	
	4			

Range of data types to receive all scan data types: 0x0000, 0xffff.
Range of data types to receive all scan data types: 0x2202, 0x220f.
Range of data types to receive all object data types: 0x2220, 0x222f.

Example 1: Receive all data types:

Bytes	Offset	Data
2	0	0x0005
2	2	0x0002
2	4	0x0000
2	6	0xFFFF

First line is the Ibeo data header, second the command data.

Example 2: Receive all scan data types:

Bytes	Offset	Data
2	0	0x0005
2	2	0x0002
2	4	0x2202
2	6	0x220f

The command will be replied by Ibeo API or ECU with data type 0x2020. The reply data is 0x0005 (the received command ID).
